Dimming operation

※ Three-in-one dimming function

The method of dimming (X/T)

A. connect a resistor 0-100K or 0-10V DC voltage or 10V PWM signal between DIM+ and DIM- to adjust the output current.

B. output current of dimming port: 108uA (typical value).

◎ With an applied voltage of 0-10V:

◎ Applying additive 10V PWM signal (Frequency range: 300Hz-2K Hz) :

◎ With an additional 0-100K resistor:

EXT	External dimming

The J-type power supply does not have light dimming, but only has dimming knob and RJ12 interface. When the dimming knob is not set to EXT in master-slave cascading mode, the RJ12 interface can receive 3-in-1 dimming signal. The function of the RJ12 interface is the same as that of the X/T type light dimming.

Connect multiple power supplies that have an RJ12 port to each other in the following mode: Connect the DIM_OUT port to the DIM_IN port of the next power supply. The power supply that is not connected to the DIM_OUT port is the host. The power supply that is connected to the DIM_OUT port is the slave power supply. Adjust the dimming knob of the host, and other slave power sources will also be dimmed along with the host power supply. Regardless of the slave knob switch in any state, all states of the slave as the master.

NOTICE:

1. RJ12 port is not waterproof. Pay attention to the operating environment to avoid the influence of water on the power supply.
2. The J-type power supply can only be cascaded with the same defined parameters as RJ12. When the number of cascades exceeds 6, do not short-circuit the output of the auxiliary power supply (Vaux+,Vaux-); otherwise, the expansion ports and cables may be damaged.
