

Light grid

LGM8

- Measuring automation light grid with switching output
- Optical resolution 8 mm
- Super-fast object detection, even with 3-way beam crossover
- Object identification using integrated object recognition
- IO-Link interface for service and process data
- Temperature range to -30 °C
- Output of a measured value, can be selected from a number of measuring functions

Measuring automation light grid with beam spacing of 8 mm, IO-Link interface, push-pull output, fixed cable with M12 plug

IO-Link

Function

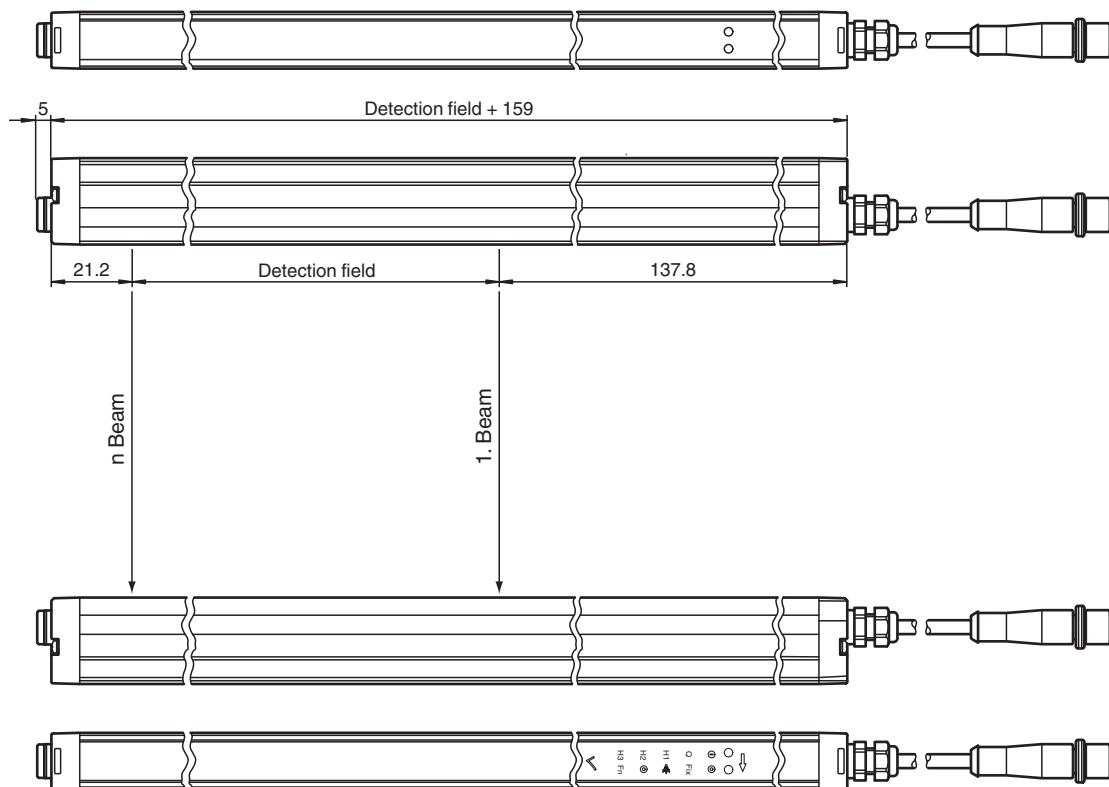

Automation light grids in the LGM Series are designed to measure small to large objects. The slimline light grids are modular in design and are available with various beam gaps and field heights. The entire signal evaluation process is carried out within the device. The lightweight systems can be integrated elegantly into their surroundings, from both a technical and a visual perspective. As a result, machines and plants operating in temperature ranges between -30 °C ... +60 °C can be designed to more compact dimensions.

Application

- Detection of objects over large areas
- Detecting and counting irregular objects
- Measuring and sorting objects of different heights (height checking)
- Presence and overhang control in material handling systems
- Web sag monitoring
- Position or shape monitoring (object identification)

Transmitter

Technical Data

General specifications

Effective detection range	Standard : 0.3 ... 6 m
Threshold detection range	7.5 m
Light source	IRED
Light type	modulated infrared light , 850 nm
Field height	see Table 1, max. 2100 mm
Beam crossover	Factory setting: three beam crossing, deactivateable
Beam blanking	adjustable max. 2 fixed suppressible beam areas (blanking)
Beam spacing	8.33 mm
Number of beams	see Table 1, max. 253
Operating mode	Emitter: Emitter power adjustable in two ranges
Optical resolution	without beam crossover: 8 mm with beam crossover: 4 mm with in 25% and 75% of the range
Opening angle	10 °
Ambient light limit	> 50000 Lux (if external light source is outside the opening angle)

Functional safety related parameters

MTTF _d	21 a
Mission Time (T _M)	20 a
Diagnostic Coverage (DC)	60 %

Indicators/operating means

Technical Data

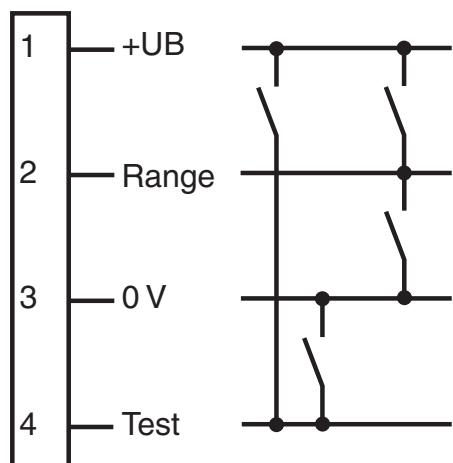

Operation indicator		
LED green: constantly on - power-on double pulse flashing (0.8 Hz) - undervoltage flashing (4 Hz) - short circuit flashing with short break (1 Hz) - IO-Link mode		
Status indicator		Emitter: LED yellow constantly on - high emitter power constantly off - low emitter power flashing (8 Hz) - error message Receiver: LED yellow: constantly on - object detected constantly off - no object detected flashing (4 Hz) - below stability control limit flashing (8 Hz) - error message
Control elements		
Electrical specifications		
Operating voltage	U_B	18 ... 30 V DC
Ripple		10 %
No-load supply current	I_0	Emitter \leq 50 mA Receiver: \leq 150 mA (without outputs)
Time delay before availability	t_v	see Table 1, max. 3.8 s
Interface		
Interface type		IO-Link (pin 4)
IO-Link revision		1.0
Device ID		1050369 ... 1050389 (0x100701 ... 0x100715)
COM-Mode		COM2 (38.4 kB/s)
Min. cycle time		2.3 ms
Process data width		16 bit
SIO mode support		yes
Input		
Test input		Emitter switch-off with +UB or 0 V at pin 4 (emitter)
Function input		Range input activation from 1.6 m with +UB or 0 V on pin 2 (emitter) Teach-In input for parameterization on pin 8 (receiver)
Output		
Stability alarm output		Stability Control (SC) 1 PNP, short-circuit protected, reverse polarity protected on pin 2 (receiver)
Switching type		Factory setting: dark on, Switchable to light-on mode
Signal output		Command interface: Pin 4 IO-Link interface C or used as switching output Q; 1 short-circuit proof reverse polarity protected push-pull output (receiver) Switch output: Pin 5 switching output Q; 1 short-circuit proof reverse polarity protected push-pull output (receiver) synchronized with pin 4
Switching threshold		Factory setting: The signal tracking for the threshold value is deactivated, increasing the optical resolution by a maximum of 4 mm; switchable to active signal tracking
Switching voltage		max. 30 V DC
Switching current		max. 100 mA
Voltage drop	U_d	\leq 2 V DC
Switching frequency	f	see Table 1, max. 118 Hz
Response time		see Table 1, max. 20 ms
Timer function		Off-delay programmable from 0 ... 1.25 s in 5 ms steps (adjustment via IO-Link only)
Conformity		
Communication interface		IEC 61131-9
Product standard		EN 60947-5-2
Approvals and certificates		
Protection class		III (IEC 61140)
UL approval		cULus Listed
CCC approval		CCC approval / marking not required for products rated \leq 36 V
Ambient conditions		
Ambient temperature		-30 ... 60 °C (-22 ... 140 °F)
Storage temperature		-30 ... 70 °C (-22 ... 158 °F)

Characteristic Curve

System Description

The light grid consists of a emitter and a receiver, between which is the area to be monitored.

The switching command and measurement of the object is triggered when an object enters or is already present in the monitoring field.

The modular system design supports a wide range of distances for the lines of light. Optimum implementation of the light grids for specific application requirements is thus possible.

The system is programmed using the integrated touch field or the IO-Link interface.

Output of the analog measured value is included in the IO-Link protocol. Users can choose from a vast selection of integrated measurement protocols.

The most important measurement protocols are:

- Lowest position of the object
- Highest position of the object
- Height of the object
- Height of the object as the total height of all partial objects
- Height of the largest partial object
- Mid-position of the largest partial object
- Lowest position of the largest partial object
- Highest position of the largest partial object
- ...

Parameterization

IO-Link

The sensor parameters are device-specific and are described in the standardized IO Device Description file (IODE). The IODE can be read into different engineering tools using IODE support from different system providers. The sensor can then be configured or diagnosed using the relevant tool and a user interface generated from the IODE. The IODE interpreter are available in the corresponding product description on our homepage, www.pepperl-fuchs.com. For the IODE description contact the Pepperl+Fuchs support.

Technical Features

Table 1:**Switch-on delay, maximum switching frequency, and maximum time delay before availability:**

Design and Function

Safety information

The device must be operated only at low protective voltage where there is safe electrical isolation. Modifications and repairs must be carried out only by your supplier!

The system must be maintained and inspected on a regular basis.

A soft, clean cloth may be used to clean the system. Do not use any aggressive or abrasive cleaning agents that will corrode the surfaces. The device must not be subjected to severe impacts or vibrations.

Commissioning

Prerequisites

- The transmitter unit and receiver unit have been mounted and aligned correctly.
- The electrical connection has been established as per the information in the connection diagram.
- The signal output responds to object measurement.
- If at least one beam of light is interrupted, the output remains active for as long as the object is detected.

Troubleshooting

- Measure operating voltage
- Check cabling.
- Check transmitter and receiver unit for dirt. Clean if necessary.

Function indicators

A green LED for indicating the operating status "Power ON" and a yellow status indication LED are fitted on the connection side of the profiles, behind the lens cover.

Transmitter Unit

Function	Description of Diagnosis
Green LED to display operating status permanently illuminated	Power On
Green LED to display operating status is not illuminated. Yellow LED to indicate status is flashing	Energy-saving mode
Yellow LED to indicate status is not illuminated	Transmission power of transmitter is low
Yellow LED to indicate status is permanently illuminated	Transmission power of transmitter is high
Yellow LED to indicate status is flashing rapidly (approx. 8 Hz)	Fault state
Yellow LED to indicate status — brief change in light emitted	Test input is activated

Receiver Unit

Function	Description of Diagnosis
Green LED to display operating status permanently illuminated	Power On
Green LED to display operating status is not illuminated	Energy-saving mode
Green LED to display operating status is flashing at brief intervals	IO-Link mode active. Possible to parameterize the device only via IO-Link
Green LED to display operating status is flashing (4 Hz)	Fault status: short circuit at the outputs
Yellow LED to indicate status is permanently illuminated	Detection field interrupted
Yellow LED to indicate status is not illuminated	Detection field is clear.
Yellow LED to indicate status is flashing (approx. 4 Hz)	Insufficient stability control
Yellow LED to indicate status is flashing rapidly (approx. 8 Hz)	Fault state: fault during signal measurement

Resolution and Beam Gap

The optical resolution of the light grid corresponds to the size of the object that can be detected.

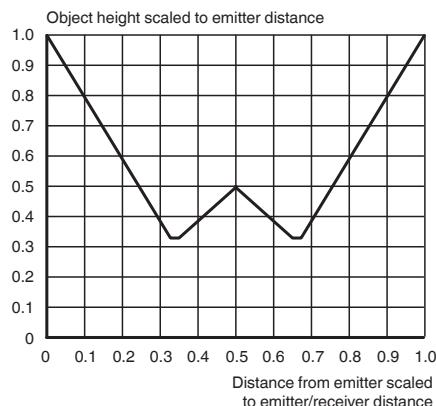

The values specified in the technical data under "Optical Resolution" apply if signal tracking for the threshold value is activated. Where the system is parameterized via the touch field menu (level 2, "Signal Tracking"), the value is automatically set to 60 %. It is not possible to set other values. To parameterize the system via IO-Link, a threshold value of at least 60 % must be entered. Signal tracking for the threshold value is deactivated by default, increasing the optical resolution by a maximum of 4 mm. By selecting 3-way crossover of the light beams, the resolution of the light grid is refined.

The switching outputs respond to any instance in which the beam is interrupted by an object. Selective object detection can also be parameterized using predefined or taught-in objects. Up to 2 beam areas can be suppressed (blanking).

The devices are supplied without object detection programmed, with signal tracking of the threshold value deactivated, and with a beam path with a 3-way crossover.

Resolution of the Crossed Beam Arrangement

If 3-way beam crossover is programmed, the resolution is refined. In the case of 3-way crossover, this means that the increased resolution is offered once 25 % of the transmitter unit range or receiver unit range has been covered. It is therefore necessary to ensure that all objects pass the transmitter or receiver with such a gap.
